

# COMFORT CONTROL™ SYRINGE

## BETTER CARE THROUGH BETTER TECHNOLOGY

Naturally, some patients get more nervous than others do at the sight of a needle and syringe. The Comfort Control Syringe™ offers a pain-less alternative to the traditional anesthetic needles and syringes.

The needle is not what causes the main discomfort of an injection. It's the flow of the anesthetic into your tissue. The Comfort Control Syringe's™ microprocessor automatically ensures a steady, slow flow rate regardless of tissue density. The constant, slow flow is the key to pain-less injections. Additionally, a flow of anesthetic fluid is directed ahead of the needle. This numbs the site of insertion and develops a pathway of anesthesia so you hardly feel the needle at all.

Routine dental injections are significantly less painful. The Comfort Control Syringe™ allows a more predictable, comfortable injection, especially in the more sensitive areas such as the palate or front of the mouth.

Experience less anxiety with your next dental treatment. Now, all anesthetic injections are performed with the Comfort Control Syringe™.
